This nucleotide sequence encodes the lysine ketoglutarate reductase (LKR, see AAW87758), or saccharopine dehydrogenase (SDH), of Arabidopsis thaliana. It was isolated on the basis of homology to fungal glutamate-forming SDH. Isolated nucleic acid fragments comprising sequences encoding all or part of plant LKR are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a suitable seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising: (1) chimeric gene above, and (i1) a second chimeric gene, synthase (DHDS) substantially insensitive to lysine inhibition is operably linked to a plant choroplast transit sequence and to a plant seed-specific regulatory sequence; (4) plants comprising in genome (1) and (i1), especially as fragment of (2); and (5) seeds
                                                                                          2964 GTCCAGACGAAAGGAGTGATCAGGCCTCTGCAACCGGAAATCTACGTTCCAGCATTGGAG 3023

                                                                                                                                                                                                                                                                                                            from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapessed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. LKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, expression of antisense RNA for LKR, and transforming plants with

```
This is the nucleotide sequence of a partial (3') cDNA encoding a rice lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDN) polypeptide (see AAW87764). It was isolated dehydrogenase (SDN) polypeptide (see AAW87764). It was isolated from an expressed sequence tag database by comparison to an Arabidopsis LKR/SDH protein (see AAW87759). Isolated nucleic acid fragments comprising sequences encoding all or part of plant carly from a subfragment) operably linked to a seed specific requiator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chlorophast transit sequence and to a plant seed-special capacitic requiatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is contivity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, and transforming plants with the chimeric gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  expressed sequence tag; Fusarium venenatum; Aspergillus niger; Aspergillus oryzae; Trichoderma reesel; identification; recombination; culture condition; environmental stress; spore morphogenesis; metabolic pathway engineering; catabolic pathway engineering; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2943 CTGCTATTGCTAAAGAATAAGGTCCAGACGAAAGGAGTGATCAGGCCTCTGCAACCGGAA 3002

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) call relative to expression of the same genes in one or more second filamentous fungal the from early of the same genes fluorescence—labeled nucleic acids isolated from the Fr cells and a substrate of expressed sequence tags (BST). The BSTS in a first filamentous fungal (FF) cell relative to expression of genes ame genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production of potential of the microorganisms to be improved. New genes may be clascovered, possible functions of unknown open reading frames can be discovered, possible functions of unknown open reading frames can be monitored. The expression of genes can be used to study how FF cells continued. The expression of genes can be used to study how FF cells continued for the monitored of the expression of genes can be used to study how FF cells continued to changes in culture conditions, environmental stress, spore endinearing. Using ESTS provides several advantages over genomic or array equals one gene or open reading frame, and organisation of the molysis of the results. AAF11248 to AAF11247 represents ESTS from Aspergillus classian wenementum; AAF1187 represents ESTS from Aspergillus chapter and present ESTS from Aspergillus oryzae; and all specifically claimed in the present invention.
                                                                                                                                                                                              expression of genes in filamentous fungal cells ad nucleic acids isolated from the cells and a

This is the nucleotide sequence of the Arabidopsis thaliana

C lysine ketoglutarate reductase (LKR)/saccharopine dehydrogenase

C (SDH) gene that includes exons coding for a 1064-amino acid

C (SDH) gene that includes exons coding for a 1064-amino acid

C c consider the companient of the companient of the constraint of the constraint of partial constraint of plant LKR polypeptides are new. Also claimed are: (1) a cromatic gene comprising the fragment (or a subfragment) operably considered to a suitable seed specific requiator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the mutation in the gene encoding LKR or transformation with the confineric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene; (3) a nucleic acid fragment comprising in second chimeric gene; (3) a nucleic acid fragment comprising in second chimeric gene; (4) plants comprising in constantially insensitive to lysine inhibition is operably linked seed-specific regulatory sequence; (4) plants comprising in component (1), aspecially as fragment of (2); and (5) seeds of from (3). The chimeric genes can be used to produce plant cells cont, soybean, rapeseed, wheat and rice (claimed). LKR is cont, soybean, rapeseed, wheat and rice (claimed). LKR is cont, soybean, rapeseed, wheat and rice (claimed). LKR is cont, soybean, rapeseed, wheat and rice (claimed). LKR is cont, soybean, rapeseed, wheat and rice (claimed). LKR is controlling a chimeric gene for cosuppression of LKR is fragment, preparing a chimeric gene for cosuppression of LKR. Claim 3; Page 168-173; 231pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

//dac_nose="rucizir"
//doce="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2:
XhoI; Morex (mla) plants were greenhouse grown in the R
Wise lab at Iowa State University, Ames, IA; 7 day old
green seedlings were infected with isolate 5874 of
Blumeria graminis f: sp. hordei, and leaves were harvested
14, 48 and 72 hr post-inoculation and snap frozen (Wise).
In the TU Close lab at the University of California,
equal quantities of all three RNA pools were combined,
poly(A) RNA was purified from the mixture, one primary
un vivo excised to give pBluescript SK(-) cDNA phagemids
(Chin). Phagemids were plated and picked at the Clemson
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).
The sequence has been trimmed to remove vector sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota: Viidiplantae: Streptophyta; Embryophyta; Tracheophyta; Spermatophyta: Magnollophyta; Lillopsida: Poales; Poaceae; Pooideae; Triticeae; Hordeum.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Whose lab at lowe State University, Ames, IA; Jite_4:

Whose lab at lowe State University, Ames, IA; J day old green seedlings were infected with isolate 5874 of Blumeria gramminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in Vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) Begum, Palmer, Flisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence abover. For more details on library preparation and sequence analysis and preparation and
                                                                                                                                                                                                                                                                                                                                                                                                                                Hordeum vulgare

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                       US-09-049-304A-122
